SAVORA

HOUSEHOLD FOOD MANAGEMENT

Know your kitchen. *Waste less of it.*

An app that tracks the food a household already has, shows what needs using first, and suggests meals built around it.

NOTAR ACADEMY HACKATHON · FOOD WASTE AT HOME · NOVEMBER 2026

Most food waste at home starts with forgetting.

01

Out of sight

Food at the back of the fridge or pantry is forgotten until it can't be used.

02

Dates slip past

Nobody keeps every expiry date in their head, so the deadline passes unnoticed.

03

Duplicate buying

Without a clear view of home, people buy a second pack of something they already own.

04

No plan to use it

Ingredients need a meal to go into. Without one, they wait until they're past using.

The result is money spent on food that ends up in the bin, and more household waste.

In 2022 the world wasted 1.05 billion tonnes of food. Most of it at home.

60%

of food waste comes from households: 631 million tonnes, more than restaurants and shops combined.

UNEP, 2024

79 kg

of food wasted at home per person each year. High- and middle-income countries differ by only 7 kg.

UNEP, 2024

73%

of food thrown away at home could have been eaten: 4.4 of 6 million tonnes, about £1,000 a year for a family of four.

WRAP, UK, 2022

Up to 10%

of EU food waste is linked to date marking: people confuse "use by" with "best before".

EUROPEAN COMMISSION, 2018

Sources: UNEP, Food Waste Index Report 2024 · WRAP, Household Food and Drink Waste in the UK, 2025 · European Commission, Market study on date marking, 2018

WHO IT'S FOR

People who shop for a household and cook at home most weeks.

Families

Several people eat from one fridge. Nobody has the full picture of what's there or what's already open.

Shared flats & couples

Two or more shoppers buy separately, so duplicates and forgotten items are common.

Busy weekly shoppers

One big shop a week means fresh food has to be used in the right order, and that's easy to lose track of.

What they share: they want to spend less on food that goes unused, and they don't have time for a complicated tracking system.

THE SOLUTION

One inventory for the whole kitchen, and three habits built on it.

01

Know what you have

Fridge, freezer and pantry in one list. Adding an item takes a few seconds because Savora fills in the details.

02

Use it in time

Clear expiry states, a seven-day timeline and meal ideas ranked by what expires first.

03

Buy only what's needed

A shopping list that blocks duplicates and warns when something is already at home.

When food is thrown away anyway, the waste log records why, so households can see where waste comes from.

KEY FEATURES

Five connected tools.

Inventory

Fast entry

Type "spinach" and the category, storage, unit and a typical date are filled in. Search, filter and sort.

Expiry

Clear states

Fresh, Use soon (≤ 3 days) and Past date, with a seven-day timeline and a use-soon view.

- Fresh
- Use soon
- Past date

Meals

Explained suggestions

24 recipes ranked by urgency and coverage, with matched and missing ingredients and a reason for each.

Shopping

No duplicates

Adds missing recipe ingredients, warns about stock at home, and moves bought items into the inventory.

Waste log

Real numbers

Quantity, reason, date and cost when known. Trends and categories come only from logged entries.

It doesn't just remind you of dates. It plans how to use everything in time.

01

A rescue plan for the week

Meals scheduled by deadline: the item with the least time left is planned first. In the demo kitchen it uses 25 of the 27 items that would otherwise reach their date, and gives the other two a step: freeze or eat.

02

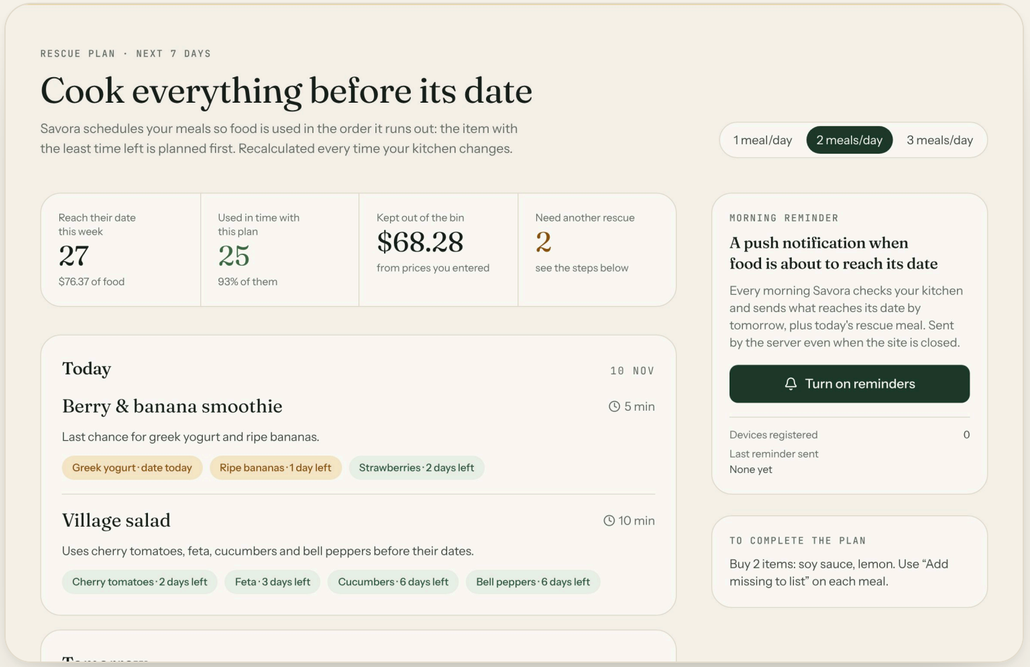

A morning push notification

Every hour the database wakes the server (pg_cron), and at their chosen hour people get what reaches its date by tomorrow and what to cook today, even with the site closed. Every send is logged.

03

Adding food in one sentence

By voice or text: "milk 2 l, eggs 10, spinach". Savora splits it into products with amounts and dates, in English or Russian, plus your usual items in one tap.

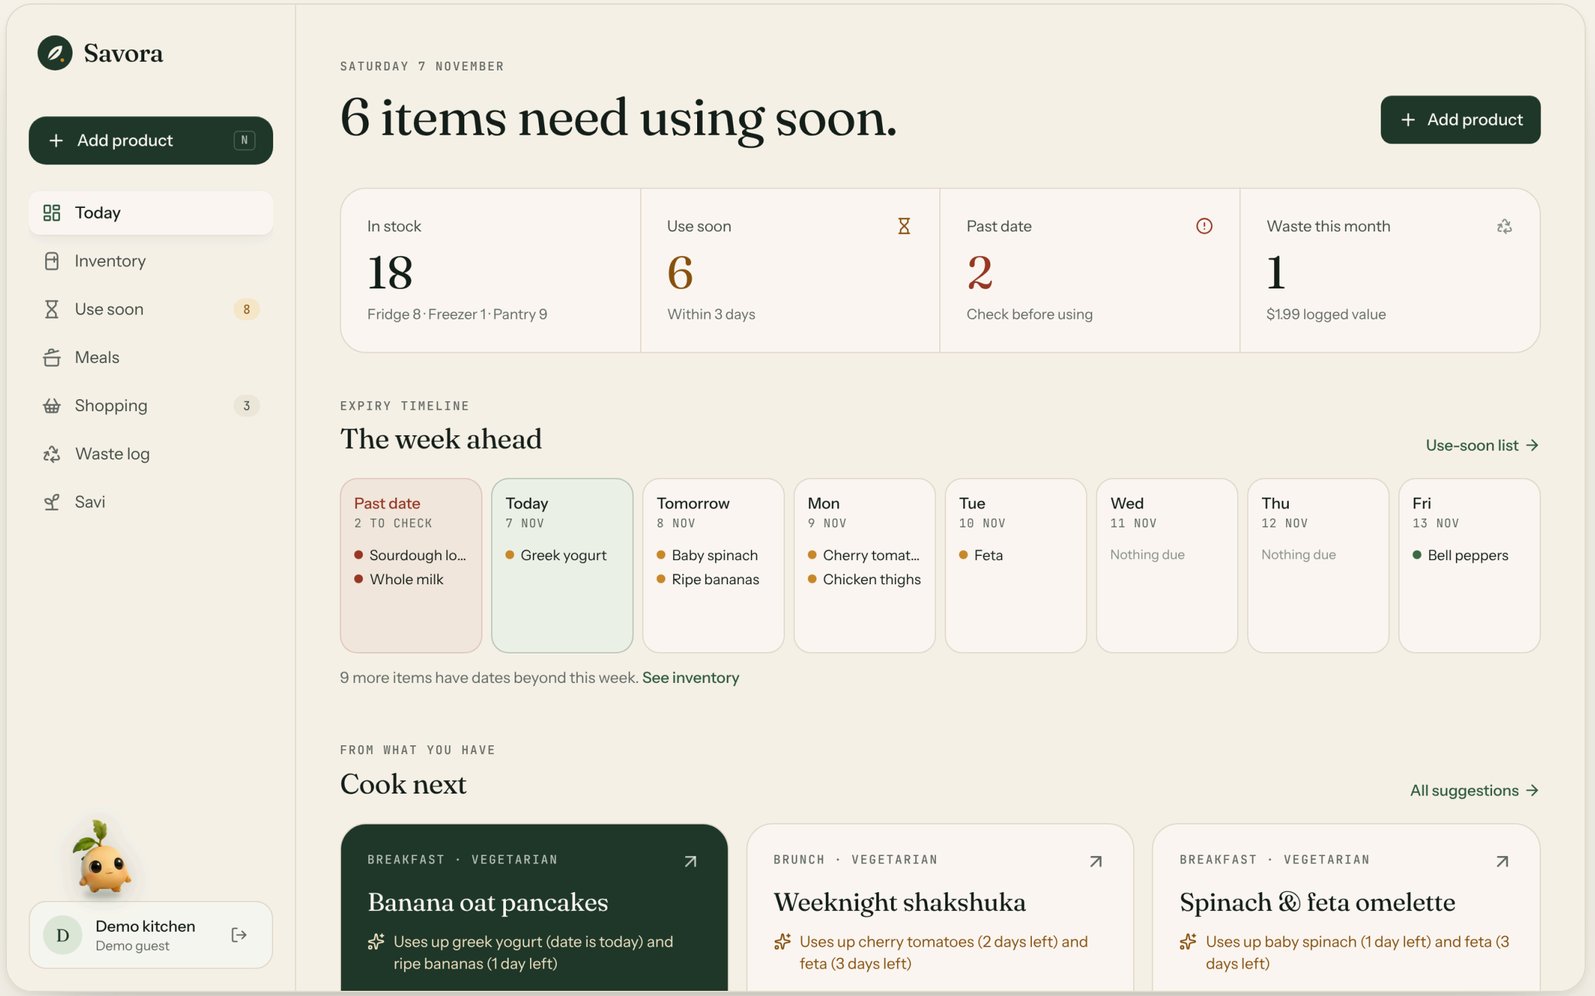

PRODUCT

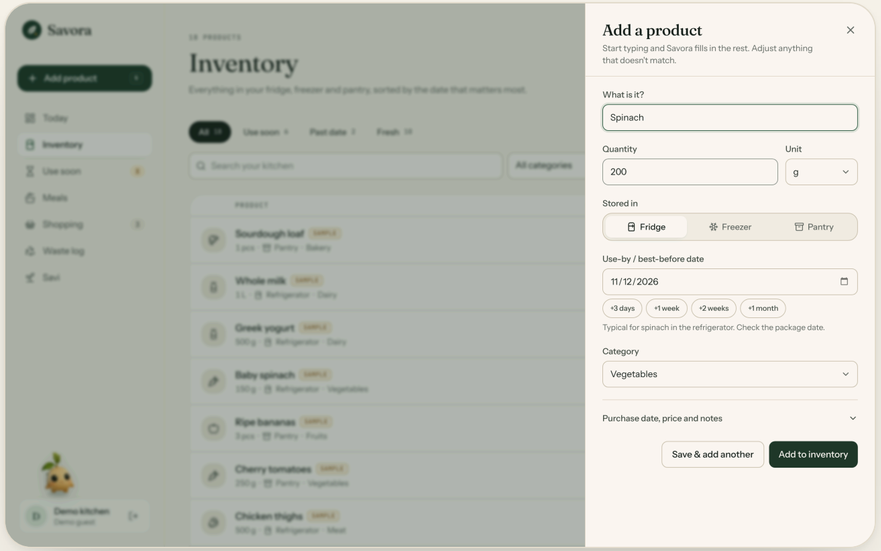

The dashboard answers one question: what needs using?

The headline, the four figures and the week-ahead timeline all come from the household's data. Meal ideas and notes below it are generated from the same inventory.

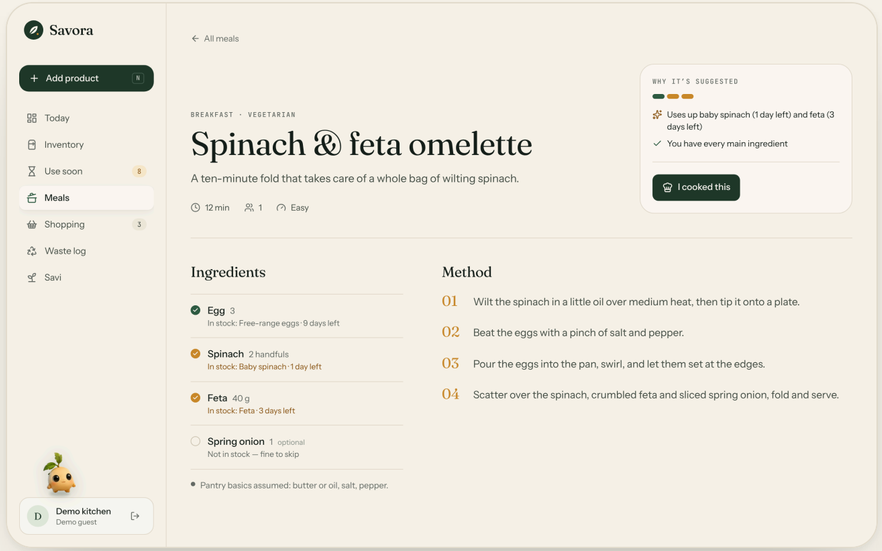

Screenshot of the working app with the demo kitchen.

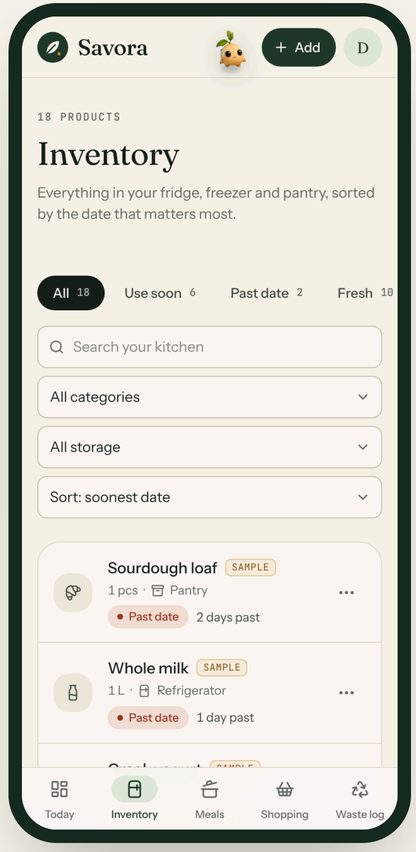

Add in seconds. Cook what expires first.

Quick add fills in details from a catalog of about 90 foods.

Each recipe shows what's in stock, what's missing, and why it was suggested.

Fully responsive, with bottom navigation on phones.

TECHNICAL ARCHITECTURE

A real backend, secured in the database.

Browser

React client

Forms, sheets and filters. Filters live in the URL. Native <dialog> for accessible modals.

Next.js 16 on Vercel

proxy.ts

Session refresh, route guard

Server Components

Reads through a data layer

Server Actions

Zod validation, typed results

Domain logic

Expiry, ranking, stats (unit-tested)

Supabase

Postgres + Auth

Row Level Security on every table. Atomic RPC functions for discard, consume and put-away.

User JWT on every query

Only the publishable key is used. No service-role key exists in the app.

Constraints & indexes

Enums, checks, date columns, a unique index that blocks duplicate list items.

Date-only logic

Whole-day arithmetic in the viewer's time zone. No off-by-one errors.

Tested

53 unit tests and a 16-step Playwright end-to-end run.

PRODUCT VALUE

Each cause of waste has a feature that answers it.

Forgotten food	One inventory for fridge, freezer and pantry, sorted by date, with a seven-day timeline on the dashboard.
Missed dates	Use-soon states and badges, a dedicated view, and notes such as "cook or freeze the chicken thighs".
Duplicate purchases	The shopping list blocks repeat entries and shows what's already at home while you type.
No meal plan	Recipes ranked by what expires first, with missing ingredients added to the list in one tap.
Not knowing the pattern	A waste log with reasons, categories, trends and cost, calculated only from what was recorded.

SAVORA

The food you already have is the easiest food to save.

Savora is a working product: a real database with row-level security, an explainable recommendation engine, and an interface designed for everyday use on any screen.
